

3.3 Analysis of Variance (ANOVA)

We also examined the interactive effect of the two key classification variables (i.e., competitiveness and size) on the observed variation in average revenue (ARIEPS). Although several approaches could be considered, we assumed a general linear (Analysis of Variance) model with three levels characterizing size as follows:

Level	No. of Subscribers in System
Small	Less than 3,000
Medium	Between 3,000 and 15,000
Large	More than 15,000

Due to the relatively small number of competitive franchises, this stratification seemed adequate to capture a nonlinear "size" effect, if it exists. Consistent with our objective of accounting for economic factors, as well as enhancing the capability to detect significant differences with respect to size and competitiveness, we included in the model a covariate term representing cost and investment factors. In fact, two covariate terms were included based on the first two Principal Components obtained from a PCA of all 23 factors. The complete computer output of both the PCA and ANOVA runs is given in Volume 2.

The ANOVA results revealed that system size and competitive status produced a highly significant interactive effect on ARIEPS. Consistent with findings discussed previously, there is no evidence of a competitive effect for large systems, here defined as systems serving more than 15,000 subscribers. However, ARIEPS for competitive franchises are significantly lower at each of the other two size levels. The ANOVA results are summarized in Table 6; values given in the table are estimates (least-squares means) that are appropriate for (i) unequal cell sizes (that is, the different number of franchises among the six categories), and (ii) accounting for the cost/investment measures introduced as a covariate.

**Table 6. Analysis of Variance Results
(Least-Squares Means)**

Size Category	Noncompetitive		Competitive	
	No. of Obs.	ARIEPS	No. of Obs.	ARIEPS
Small	184	\$20.83	19	\$15.00
Medium	83	\$21.94	14	\$16.59
Large	103	\$22.11	17	\$21.84

The implication of this analytical finding is two-fold;

- (i) There is evidence that ARIEPS monotonically increases with system size; the (very) small systems serving less than 3,000 subscribers exhibit significantly lower revenue regardless of competitive status; and
- (ii) Due to the statistical significance of the interactive effect, comparisons of main-effects (i.e., competitive versus noncompetitive) are misleading; benchmark comparisons must necessarily and explicitly take into account system size in order to be meaningful.

4. Regression Diagnostics and Robustness of FCC Analysis

Regression has many useful applications, one of which is to associate a cause (e.g., competitiveness) with an effect (e.g., lower average revenue) as the FCC purports to have done. However, as with any analytically-sound technique, implicit in its use is strict adherence to key underlying assumptions. While it is true that all assumptions are rarely met in practice, it is nonetheless of critical importance that data analysts and decision-makers alike recognize the impact of potentially serious violations of assumptions necessary for results to be valid.

Recent publications in the statistical literature deal extensively with techniques for assessing validity. Two of the more popular texts are *Regression Diagnostics* by Belsley, Kuh and Welsch (Wiley, 1990) and *Robust Regression and Outlier Detection* by Rousseeuw & Leroy (Wiley, 1987). Although the procedures discussed in these texts are highly technical and require specialized expertise in their application, the implementation of the FCC regression model as a "predictor" or benchmark for setting rates more than justifies their relevance and consideration. It is not uncommon to hear that "statistics can prove just about anything"; nor, unfortunately, is data-dredging an infrequent occurrence. In light of these, as well as more constructive criticisms, it is extremely important that the FCC sample data, regression analysis, and subsequent results be subjected to a comprehensive treatment of diagnostic techniques currently available in the statistical literature as cited above.

A thorough application of diagnostic procedures is time-consuming and it was beyond the scope of our assignment. Nevertheless, we have attempted to identify outliers, i.e., spurious observations, influential data points, and sources of collinearity that, if present and undetected, could seriously affect model stability.

We address the following fundamental concerns:

- (i) The effect of weighting observations (i.e., franchises) according to size;
- (ii) Problematic statistical issues inherent in the FCC analysis;
- (iii) The use and interpretation of some standard regression diagnostic techniques.

Weighting by Size - Much of the discussion and controversy surrounding the use of the model as a benchmark focuses on the "size" issue. The model is derived from franchises that represent a disproportionately small number of subscribers served by the cable industry. One way to compensate for this imbalance is to weight each observation according to the number of subscribers served by the system that operates the franchise. In effect, instead of exerting equal influence on the derivation of regression coefficients, a franchise representing 20,000 subscribers is considered ten times more influential than a counterpart representing 2,000 subscribers. Stated another way, the analysis is equivalent to using ten observations for the former and one for the latter as input to the analysis.

In Table 7, we present the results of the FCC model when weighting each of the 420 observations according to size. The key result here is that the coefficient associated with the OVL term, used by the FCC to quantify the competitive effect, essentially disappears; that is, the estimated coefficient is 0.0016 with a relatively large standard error of 0.033.

As a consequence, OVL (or, equivalently, competition in the FCC definition) has no explanatory power whatsoever with respect to ARIEPS (revenue).

The implication of this finding is crucial to the FCC argument. By directly accounting for size in the data, it is not surprising that a totally different outcome has been observed. Furthermore, the influence of the make-up of the data set used to derive the model has been demonstrated to have a significant impact on the value and interpretation of individual coefficients in the model. It is this type of data-sensitivity that often (and justifiably) casts doubt on a strict interpretation of individual regression coefficients.

Problematic Statistical Issues - In addition to the issue of representativeness of sampled franchises, several other fundamental concerns should be addressed. For example, the OVL term is critical to the FCC claim that competition effectively reduces ARIEPS. Furthermore, the effect is quantified to be approximately 17%. However, theory dictates (and most practitioners acknowledge) that independent variables used in regression models should be measured precisely (i.e., without error). In varying degrees, several of the thirteen terms used in the FCC model are subject to uncertainty; the problem seems particularly acute when quantifying OVL. In fact, as discussed elsewhere, OVL is known to have been incorrectly specified for some of the franchises contacted in our survey.

Another common difficulty encountered in regression is the condition of collinearity. Collinearity occurs when explanatory variables themselves, assumed to be independent, are correlated in the statistical sense. This condition, if it exists, can cause havoc on the interpretation of individual coefficients, namely, OVL. Correlation tables given in Volume 2 reveal that OVL is correlated with other terms in the model, indicating that caution should be exercised in interpreting coefficients that supposedly isolate the effect attributable to a competitive environment.

Another major concern involves the data set itself. Even if all measures were reasonably accurate (which has been demonstrated not to be the case), there is further evidence that subsets of the data have a disproportionate influence on the FCC estimated model. The importance of influential observations is emphasized in the following quote, extracted from the aforementioned text authored by Belsley, Kuh and Welsch (page 3):

"The fact that a small subset of the data can have a disproportionate influence on the estimated parameters or predictions is of concern to users of regression analysis, for, if this is the case, it is quite possible that the model estimates are based primarily on this data subset rather than on the majority of the data."

While the authors point out that unusual or influential data points are not necessarily bad, it is only after they have been identified that their quality can be assessed and appropriate action taken. In the context of the rate-setting application, it is important that such data points be appropriately handled.

Regression Diagnostics - Our regression output generated by the SAS PROC REG software package includes an array of diagnostic measures. Criteria for interpreting these measures are discussed in the literature and will not be explained here. As a simple illustrative example, one of the measures (the studentized residual) provides insight concerning observations (franchises) that yield extreme discrepancies between actual ARIEPS and the corresponding value estimated by the model. A few of the differences that are highly significant are listed in Table 8.

Table 8. Sample Franchises with Large Prediction Error

Franchise	ARIEPS (Actual)	ARIEPS (Predicted)	Residual (Difference)	
XX 0003	\$ 7.50	\$18.23	-\$10.73	Model Over- Predicts
MO 0373	\$11.80	\$22.79	-\$10.99	
AL 0127	\$11.07	\$19.49	-\$ 8.42	
GA 0025	\$13.71	\$22.14	-\$ 8.43	
GA 0025	\$13.48	\$20.09	-\$ 6.61	
KY 0007	\$10.22	\$16.41	-\$ 6.19	
NJ 0373	\$29.58	\$17.66	+\$11.92	Model Under- Predicts
NJ 0373	\$26.95	\$19.12	+\$ 7.83	
NH 0019	\$35.84	\$22.55	+\$13.29	
NY 1414	\$32.23	\$21.85	+\$10.38	
CA 1119	\$28.05	\$19.28	+\$ 8.77	

In addition to the fact that the FCC model is obviously a poor predictor of revenue for these few franchises, inspection of other diagnostic measures (not included here) suggested that several of these franchises were indeed highly influential. This does not necessarily imply that they should have been deleted, but it does suggest a need to *verify the data* collected for these franchises.

It was not the intent of our assignment to conduct a thorough diagnostic evaluation of the FCC regression model. If it were, we would have first eliminated apparent errors in the data base, and subsequently attempted to reconcile other discrepancies that have been detected. Rather, the purpose of this discussion is to emphasize the possible significance of potential data problems to the FCCs estimation of the competitive price differential, and to pinpoint the estimated coefficients (primarily the one associated with the OVL term) that are potentially most adversely affected.

Objective

Arthur D. Little Inc. is helping NCTA and CATA respond to the FCC's rulemaking on cable TV rates. The FCC based its new rules on cable system rates and services as of September 1992. Our questions concerning your system will help NCTA and CATA comment on the FCC's approach.

FACILITIES

1. What addressable & non-addressable converters are in your system? (CHECK DATASHEET ON ADDRESSABILITY)
 - Suppliers & Model numbers?
 - How obtained: Purchased new? Used? Transferred from other systems?
 - When obtained?
 - Proportions of subscribers having each model of converter? Do these proportions differ for franchise area vs. overall system?
 - Changes since September 1992?
2. What is the channel capacity of your system in the franchise area? (CHECK DATASHEET ON CHANNEL CAPACITY)
 - How many channels activated?
 - Differences between franchise area and overall system?
 - Differences between overbuilt portions and rest of franchise area?
 - Change in channel capacity since September 1992?
3. Do you have a local origination or public access studio?
 - Cost to set up this studio? When built?
4. Do you operate any other facilities required by the franchise agreement, e.g., institutional network for town government, or for schools?
 - Cost to build these facilities? When constructed?
5. When was the franchise area constructed? (CHECK DATASHEET ON AGE OF HEADEND)
 - Rebuilds & upgrades since original construction? When? What \$/mile on average?
6. Was franchise area constructed or acquired by current owner?
 - If acquired:*
 - Purchase price? Date of purchase? Subscribers at time of purchase? Existence of overbuild at time of purchase? (CHECK DATASHEET FOR NOTES ON OVERBUILD)
 - If constructed:*
 - Original capital investment for the system in terms of:
 - \$/mile?
 - \$/Home passed?
 - \$/Subscriber
 - Differences for franchise area vs. overall system?

GET NAME & PHONE NUMBER OF COMPANY ENGINEER OR OTHER SOURCE ON CAPITAL INVESTMENT IF THEY CAN ADD MORE INFORMATION.

OPERATIONS

7. How many satellite-delivered cable networks are you providing? (CHECK DATASHEET)
 - How many in tiers above basic?
 - Proportions of subscribers for higher tiers?
 - Differences between franchise area and overall system?
 - Changes since September 1992?
8. How many subscribers for basic? and for each higher tier?
 - How much subscriber churn (%) each year?
 - In franchise area versus overall system?
 - Changes since September 1992?
9. How many employees in the system?
 - In the franchise area (if counted separately)?
 - Number of customer service representatives (CSRs)? System vs. franchise area?
 - Field employees (technicians, installers, supervisors)? System vs. franchise area?
 - Changes since September 1992?
10. Current rates for basic and for each higher tier, per month?(CHECK DATASHEET ON RATES & COMMUNITIES SERVED)
 - Rates for equipment rental?
 - Difference between franchise area vs. other parts of system in surrounding areas?
 - Rate changes since September 1992?
11. Financial performance:
 - Average revenues per subscriber?
 - Average operating expenses per subscriber?
 - Average cash flow per subscriber? or CF margins? (CASH FLOW = INCOME BEFORE DEBT SERVICE, DEPRECIATION, CAPITAL INVESTMENT & TAXES)
 - Revenues per subscriber from *regulated* basic & satellite programming tiers, excluding non-regulated pay cable or other sources?
 - Annual depreciation expense?
 - Differences for franchise area vs. overall system?
 - Changes since September 1992?

SPECIAL CONDITIONS

12. Special conditions in franchise area:
 - Financial situation for one or both systems?
 - Significant rate changes?
 - Changes in system plant and/or services?
 - Special features of overbuilt areas vs. entire franchise areas?
